

Numerical hero band:

000 MW
total capacity

00%
US-owned share

00
cables to world

00%
pop within 500s

1. HOOK: Where does the AI you used today actually live?

Hero map: bubble map of Australia
(All data centre locations)
size = capacity / colour = operator type

chart 1. (M)

2. CLUSTER: Why almost all of it live in two cities

Stacked bar by state
(capacity x state
decomposed by operator)

Tree map = ownership
area = capacity
share
colour = nationality

Top 10
operators
horizontal bar
length = capacity

Sydney Suburb Zoom map
faceted bubble at suburb level

Melbourne Suburb Zoom
map
faceted bubble at suburb level

3. Lifetime: How data physically gets in and out

submarine cable arc map
arcs from AU landings to world
width: capacity, colour = saturation

cable redundancy map
color: number of alt paths

cable to DC flow diagram
layered map: clusters + landings +
+ arcss arc width: capacity served

cable consortium matrix
heatmap: country x cable

4. The Tax: What this means if you live outside Melbourne or Sydney

Latency choropleth (SA4)
colour = ms to nearest hyperscaler
derived data: distance + fibre factor

Latency tax small multiples
5 panels: regional cities
bar + reference rule + annotation

Per capita choropleth
MW per 100k by state

capacity vs population
scatter + reference line

Latency tier ref.
use case bands annotate

5. Verdict: Where Australia stands and what is at stake

Time series: capacity over years
annotated with launch events

cable to operator Sankey
flow: cables to operators
